

Programming Assignment 1

Polynomial

In this assignment, you will implement a polynomial and operations on it using a linked list.

Worth 60 points (6% of course grade)

Posted Fri, Jan 26

Due Fri, Feb 9, 11:00 PM (**WARNING!! NO GRACE PERIOD**).

Extended deadline (with ONE time free extension pass): Mon, Feb 12, 11:00 PM (**NO GRACE PERIOD**)

You get ONE free extension pass for assignments during the semester, no questions asked. There will be a total of 5 assignments, and you may use this one free extension pass for any of the 5 assignments.

A separate Sakai assignment will be opened for extensions AFTER the deadline for the regular submission has passed. The extension will be 3 days (72 hours). If/when you choose to use the one-time extension, you don't need to ask for permission - just drop your submission in the extension assignment. And you can do this even if you dropped something in the regular submission, and later on decided to use the extension - in this case, only the extension submission will be graded, the regular submission will be ignored.

-
- You will work **individually** on this assignment. Read the [DCS Academic Integrity Policy for Programming Assignments](#) - you are responsible for this. In particular, note that "All Violations of the Academic Integrity Policy will be reported by the instructor to the appropriate Dean".
 - **IMPORTANT - READ THE FOLLOWING CAREFULLY!!!**

Assignments emailed to the instructor/TAs/graders will be ignored--they will NOT be accepted for grading. We will only grade submissions in Sakai.

If your program does not compile, you will not get any credit.

Most compilation errors occur for two reasons:

1. You are programming outside Eclipse, and you delete the "package" statement at the top of the file. If you do this, you are changing the program structure, and it will not compile when we test it.
2. You make some last minute changes, and submit without compiling.

To avoid these issues, (a) **START EARLY**, and give yourself plenty of time to work through the assignment, and (b) **Submit a version well before the deadline** so there is at least something in Sakai for us to grade. And you can keep submitting later versions (up to 10) - we will accept the **LATEST** version.

Background

Read Section 3.1 in the textbook for background on polynomials and polynomial arithmetic.

A polynomial may be represented using a linked list as follows: for every term in the polynomial there is one entry in the linked list consisting of the term's coefficient and degree. The entries are ordered according to ASCENDING values of degree, i.e. lowest degree term first, then next lowest degree term and so on, all the way up to the highest degree term. **IMPORTANT:** Zero-coefficient terms are NOT stored.

For example, the following polynomial (the symbol '^' is used to mean 'raised to the power'):

$$4x^5 - 2x^3 + 2x + 3$$

can be represented as the linked list of terms:

$$(3,0) \rightarrow (2,1) \rightarrow (-2,3) \rightarrow (4,5)$$

where each term is a (coefficient,degree) pair.

Notes about representation:

- Terms are stored in ASCENDING order of degrees from front to rear in a non-circular linked list.
- Zero-coefficient terms are NOT stored.
- **An EMPTY (zero) polynomial is represented by a linked list with NO NODES in it, i.e. referenced by NULL.**
- Coefficients are floating point numbers
- Degrees are POSITIVE integers, except if there is a constant term, in which case the degree is zero.
- There will not be more than one term in the same degree.

If you do not represent all your polynomials (the initial inputs as well as those you get out of doing arithmetic on polynomials) as above, you will lose credit even if your results are mathematically correct.

Implementation and Grading

Download the attached [polynomial_project.zip](#) file to your computer. DO NOT unzip it. Instead, follow the instructions on the Eclipse page under the section "Importing a Zipped Project into Eclipse" to get the entire project into your Eclipse workspace.

You will see a project called [Polynomial](#) with the following classes in package [poly](#):

- [Node](#)
- [Term](#)
- [Polynomial](#)
- [Polytest](#)

(Aside from these, there are also three sample input files, described in the **Running the Program** section below.)

You need to complete the implementation of the [Polynomial](#) class where indicated in the following methods:

Method	Grading Points
evaluate	10
add	25
multiply	25

Efficiency is not a requirement for any of the methods. And, you can use [Math](#) class methods as needed.

Note: You will get a zero if you use any other data structure (e.g. array/arraylist) *anywhere* in your implementation, for any reason, even if it has nothing to do with the actual polynomial operations. You must work with linked lists **ONLY** all the way through.

Observe the following rules while working on [Polynomial.java](#):

- Only fill in the code in the methods [add](#), [multiply](#), and [evaluate](#) where indicated.
- In methods that return a [Polynomial](#) ([add](#) and [multiply](#)), the polynomial that is returned must be represented as described in the "Notes about representation" part of the **Background** section above.
Your method will not get credit if the returned polynomial does not adhere to this representation, even if it is mathematically correct.
- Also see the "Notes about empty (zero) polynomials" at the end of the **Running the program** section below.
- **DO NOT** remove the import statements at the top of any of the given classes.
- **DO NOT** add any import statements to the original list of imports in [Polynomial.java](#)
- **DO NOT** change the headers of ANY of the given methods
- **DO NOT** change/remove any of the given class fields
- **DO NOT** add any new class fields.
- **YOU MAY** add new helper methods, but you must declare them **private**.

- Do not change `Node` and `Term` in any way. You will not be submitting them, and we will be using the original versions to test your `Polynomial` implementation.
- If you wish to change `Polytest`, feel free. You will not be submitting it, and we will not be using it to grade your `Polynomial` submission.

Running the program

There are three sample input files for you to test (they should be under the project folder in Eclipse):

- A file `pctest1.txt` that contains the polynomial

$$4x^5 - 2x^3 + 2x + 3$$

- A file `pctest2.txt` that contains the polynomial

$$8x^4 + 4x^3 - 3x + 9$$

- A file `pctest1opp.txt` that contains the polynomial

$$-4x^5 + 2x^3 - 2x - 3$$

(the negation of the polynomial in `pctest1`)

In each of these files, each line is a term, with the first value being the coefficient, and the second value being the degree. The terms are listed in **descending** order of degrees and the respective non-zero coefficients. Remember that when you store a polynomial in a linked list, you will store it in **ascending** order of degrees. (This is actually already implemented by the `Polynomial` constructor when it reads a polynomial from an input file. All you have to do is make sure you stick with this rule when you add and multiply.)

You may assume that we will NOT test with an invalid polynomial file, i.e. every test input file will either have at least one term in the correct format, or will be empty (see **Notes about empty (zero) polynomials** below). So you don't need to check for validity of input.

Here's a sample run of the driver, `Polytest`. Apart from `pctest1.txt`, `pctest2.txt`, and `pctest1opp.txt`, a fourth test polynomial file, `pctestnull.txt` is also used. This is an empty file that stands for a null (zero) polynomial - you will need to create this yourself. See notes after the test run for special instructions regarding zero polynomials.

Enter the name of the polynomial file => `pctest1.txt`

$$4.0x^5 + -2.0x^3 + 2.0x + 3.0$$

1. ADD polynomial
2. MULTIPLY polynomial
3. EVALUATE polynomial
4. QUIT

Enter choice # => 1

Enter the file containing the polynomial to add => `pctest2.txt`

$$8.0x^4 + 4.0x^3 + -3.0x + 9.0$$

Sum: $4.0x^5 + 8.0x^4 + 2.0x^3 + -1.0x + 12.0$

1. ADD polynomial
2. MULTIPLY polynomial
3. EVALUATE polynomial
4. QUIT

Enter choice # => 1

Enter the file containing the polynomial to add => `pctest1opp.txt`

$$-4.0x^5 + 2.0x^3 + -2.0x + -3.0$$

Sum: 0

1. ADD polynomial
2. MULTIPLY polynomial
3. EVALUATE polynomial
4. QUIT

Enter choice # => 1

Enter the file containing the polynomial to add => ptestnull.txt

0

Sum: $4.0x^5 + -2.0x^3 + 2.0x + 3.0$

1. ADD polynomial
2. MULTIPLY polynomial
3. EVALUATE polynomial
4. QUIT

Enter choice # => 2

Enter the file containing the polynomial to multiply => ptest2

$8.0x^4 + 4.0x^3 + -3.0x + 9.0$

Product: $32.0x^9 + 16.0x^8 + -16.0x^7 + -20.0x^6 + 52.0x^5 + 38.0x^4 + -6.0x^3 + -6.0x^2 + 9.0x + 27.0$

1. ADD polynomial
2. MULTIPLY polynomial
3. EVALUATE polynomial
4. QUIT

Enter choice # => 3

Enter the evaluation point x => 2

Value at 2.0: 119.0

1. ADD polynomial
2. MULTIPLY polynomial
3. EVALUATE polynomial
4. QUIT

Enter choice # => 4

The sample tests we have given you are just for starters. You will need to create other tests of your own on which you can run your code. For every test you run, be careful to keep your test input in the same format as the test files provided, otherwise **Polytest** will not work correctly. And make sure your test file is in the same folder as the other files, i.e. under **Polynomial**.

Note on translation from internal to output representation:

The **toString** method in the **Polynomial** class returns a string with the terms in descending order, fit for printing. (It process the ascending ordered terms of the input linked list in reverse order.) For illustration, see how the **add** method in **Polytest** prints the resulting polynomial:

```
System.out.println("Sum: " + Polynomial.toString(Polynomial.add(poly1,poly2)) + "\n");
```

Notes about empty (zero) polynomials:

- If you want to test with an empty polynomial input, you should create a file with nothing in it. In Eclipse, you can do this by right clicking on the project name in the package explorer view, then selecting **New**, then selecting **File**. Give a name, and click **Finish**. Your new file will show up under the project name folder in the package explorer view, and the file will be opened in the text editor view. But don't type anything in the file.
- Remember that when you add two terms of the same degree, if you get a zero coefficient result term, it should not be added to the result polynomial. As listed in the "Notes about representation" in the **Background** section, zero-

coefficient terms are not stored.

- The string representation of a zero polynomial is "0" - see the `toString` method of the `Polynomial` class. So, the `Polytest` driver will print a zero for a zero polynomial input, or a zero polynomial that results from an operation performed on two polynomials.

Submission

Submit your `Polynomial.java` source file (NOT `Polynomial.class`), in Sakai -> Assignments. **Submission of the wrong file will result in loss of credit.**

Refer to the instructions in the **Eclipse** page, under the section **The Eclipse Workspace** to know how to locate `Polynomial.java` on your computer for uploading.

Grading Process

Your submission will be auto-graded by a grading script that will run several test cases on each of `evaluate`, `add`, and `multiply`.

For each test case, the result computed by your code will be compared with that computed by our correct code. Each test case is a unit of partial credit, so credits for a method are accumulated one test case at a time. There is no partial credit within a test case: either your program works on a test case (full credit for that test case), or it doesn't (no credit for that test case.)

Grading will be done after the submission deadline has passed. There is no real time feedback when you submit. You can submit to Sakai up to 10 times, and each submission will overwrite the previous. This means the auto-grader will only grade the last submission since that will be the only submission in Sakai when the deadline has passed.

Note that for the `add` and `multiply` methods, the auto-grader will examine the resulting linked list, NOT printed output. (The auto-grader does NOT use `Polytest` at all - that is just for your use.) In other words, the grading script will compare the linked list structure of the correct result with the linked list structure in your implementation. For `evaluate`, the returned float value will be checked.

If you call the `add` method in your `multiply` implementation, be aware that if your `add` implementation does not work correctly, your `multiply` method's correctness will be adversely impacted as well, and you will lose credit for it as well for the failed test cases.

All printed output will be ignored. This also means if you threw in print statements for debugging and left them in your code, they will have no bearing on the grading.

When grading is done, your grade report will be emailed to your Rutgers address. Test cases will be posted so you can run your program against them to cross-check against the grade report. Remember, verification means checking the contents of the linked list for `add` and `multiply`, and the return value of `evaluate` -- NOT what your program might print.
